Principle of Nutritional Assessment - How useful it is.

By Chukwudike Nwankwo

Ideal methods of nutritional assessment are sensitive and specific. Unfortunately, it is difficult to achieve both in the assessment of nutritional status. Sensitivity refers to the ability of a technique to correctly identify those affected by a condition (for example, under-nutrition) as having that condition. Specificity refers to the ability of a technique to correctly classify normal individuals as having normal nutritional status. Body mass index is a global measure of nutritional status that illustrates the difference between these two constructs. Most persons who consume insufficient energy have low body mass index, so the measure is sensitive. However, there are other causes of low body mass index, including genetics and disease, so body mass index is not specific to nutritional status. The above are what I wanted to understand before I made the purchase and fortunately this book clearly in the most simple terms gave good insight into these issues thereby assisting me to have a good stepping stone to proffering solutions to diverse nutritional assessment problems.

Great but costly for 1990 publication

By JPS

Green Hardcover (1990 publication):

A fantastic book; both technical and well referenced. I acquired this book years ago from during my graduate studies, and came to Amazon looking for an updated version. Found the green hardcover (1990) and the orange hardcover (2005) published versions. The 1990 version makes it difficult for me to suggest it is still worth the price at ~\$125. Get it used...and save a hundred dollars. The 2005 revision is less money; may entertain the purchase to compare.
